FreeRTOS-SMP Debugging

- RR Rohith R
- **Forum name:** #Debugging

Hi Team,

I am trying to debug FreeRTOS-SMP on quad core using Trace 32.

(i) I want to know How can I see the registers of all the 4 cores at a time?

(ii) Also How can I debug (step into the codes) all the 4 cores at the same time .

To do all these what changes I have to do in the .cmm file

Hello Rohit, first, you use an SMP CPU selection in TRACE32 PowerView. If you can give me more information about your target processor, then I could help you more with this. Please then have a look to "SMP Concept" and "Basic Debugging (SMP)" in

https://repo.lauterbach.com/pdf/training_debugger_smp.pdf

My target processor contain 4 A53 core. So that I have to run the code on all this 4 cores. I can load and run the program but i don't know on which core the code is running. I want to view the registers of all cores as a part of debug. I need 4 debug windows ,one for each core so that when i step in the code i can see it on all the 4 cores. Here I am adding some portion of my .cmm file. SYStem.CPU XXXX SYStem.CONFIG CORE 1. 1. CORE.ASSIGN 1. 2. 3. 4.

```
***** Data.LOAD.Elf "xxx_smp.elf" ;.out smp file for 4 core
```

```
Register.Set PC _init_ /CORE 1. Register.Set PC _init_ /CORE 2. Register.Set PC _init_ /CORE 3.
```

Go _init_ Mode.HII WinPOS 0. 0. 116. 26. List.auto By this code a single window with _init_ code portion will come.It may be the 4th core.

You need to open a List window with the /CORE option: List.auto /CORE 0 List.auto /CORE 1 List.auto /CORE 2 List.auto /CORE 3

I have tried with this. Now I can see the code snippet and registers of all the 4 cores at the same time. But Now there is a problem when debugging, step in it is not properly step in all the 4 core simultaneously. Is it the issue with .cmm file?

Also List /CORE Register.view /CORE Go __system_start List /CORE 1. Register.view /CORE 1. Go __system_start List /CORE 2. Register.view /CORE 2. Go __system_start List /CORE 3.

Register.view /CORE 3. Go `__system_start` When I use this code snippet to debug from `__system_start` in all the 4 cores, core1, core2 and core3 is available. Core 0 `__system_start` and its registers are not available.
