"PRACTICE Stack Overflow" when using GLOBALON PBREAK DO "do_something.cmm" Open Discussion

- **Forum name:** #Other Use Cases

I have registered a event for PBREAK with below cmd:
'GLOBALON PBREAK DO "do_something.cmm"'

And this breakpoint will be hit too frequently & also in large number.

I have added 'ENDDO' at end of the 'do_something.cmm' script but problem is there is a 'GO' cmd before 'ENDDO' cmd, because of which 'ENDDO' is not being executed after 'GO'. So, stack is not cleared & also as per my observation with 'PMACRO' window, there were many instances of the above script which were not cleared.

If I remove 'GO', processor will not come out of breakpoint.

below are my needs now:
-> how to execute some cmds in cmm script after 'GO' cmd got executed.
or
-> Is there any options available with 'GLOBALON' cmd to bring processor out of breakpoint after script got executed

Hello,

In this case you can replace the DO command with a JUMPTO inside a script,for example:

GLOBALON PBREAK JUMPTO do_it

STOP

do_it:

...

Go

STOP
