Update of Breakpoint after recompilation

- C Clemens
- **Forum name:** #Debugging

Is there any way that an existing breakpoint gets automatically adjusted after the binary has changed due to recompilation?

If i have set a breakpoint and change the programm, the breakpoint will stay at the old adress / position.

So after changing the programm / binary i always have to reset each single breakpoint.

In comparison to GDB compatible debugger (i.e. Eclipse with J-Link) i will get this automatically.

Is there an option in T32 to enable this?

Because it really SUCKS to always refresh breakpoints manually!!!

Hello Clemens, you can do this using a PRACTICE script: ; ---- STOrE breakpoints.cmm Break ; execute the commands that reload the symbols DO breakpoints.cmm ; ---
