[Arm] I get a "debug port fail" error after resuming the program execution

2023-11-14 - Comments (0) - Arm

Connection to the target is possible (**SYstem.Up** / **SYstem.Mode Attach** + **Break**). After resuming the execution (**Go**), a "debug port fail" error or similar is returned at a later point.

Possible reasons:

- The debug module or JTAG has been disabled by the target software
- The core went in power saving mode
- The target application has crashed
- Illegal access by the debugger e.g., software breakpoint on illegal address

Possible Solutions:

- Verify if the problem is related to a debugger access, by removing breakpoints and closing all windows that can access the memory on run-time
 - Check **SYstem.LOG.List** for addresses related to this error
 - Check if **MAP.DenyAccess** can help to prevent the debugger from doing an illegal access
- Debug the target application until the point where the connection is lost in order to find the reason of the error.
