[AUTOSAR] Error "register set not defined"

2022-01-12 - Comments (0) - OS-aware debugging

The ORTI file has to include the **CONTEXT** object so that the debugger can display the context of inactive tasks. If this object is missing in the ORTI file, the error message "register set not defined" is returned by the debugger when you try to select an inactive task from the **TASK.List** window or when using the command **Register** or **Frame** with the **/TASK** option.

Please contact the OS vendor for more information.
