At first instance, it was really hard to understand, but after repeated trials and multiple documentation, i was able to play with Trace32 using python. Can you please share the example project carV2cockpit.py for us to explore more.

Thanks for this training video that let me know how to use Python to control Trace32, can you share the script? I have been studying how to use python scripts to automatically control trace32 startup and various operations. Is the interface control enabled? Do you have any relevant information? Thank you so much!
