Can I execute a PRACTICE script when a breakpoint is hit?

2026-07-31 - Comments (0) - PRACTICE

Yes. The `Break.Set` command provides the `/CMD` option, which executes a TRACE32 command whenever the breakpoint is hit.

For example:

```
Break.Set /Program /CMD "DO myScript.cmm"
```

When the breakpoint is reached, TRACE32 executes the specified PRACTICE script.

If you want the target program to continue running after the script has finished, add the following command to the end of the script:

```
Go
```

Alternatively, `Break.Set` supports the `/RESUME` option, which automatically resumes target execution after executing the command specified with `/CMD`.

However, `/RESUME` is **not** suitable when the command is a script execution like `DO myScript.cmm`, because target execution resumes immediately after the `DO` command is issued and **does not wait for the PRACTICE script to complete**. If the script needs to perform debugger operations before the target continues, it should explicitly end with a `Go` command instead.
