Is it possible to execute a PRACTICE script when a breakpoint is hit?

2021-09-17 - Comments (0) - PRACTICE

You can set the breakpoint with the command

```
Break.Set /Program /CMD "DO myScript.cmm"
```

To continue the execution of the target program, add the command **Go** to the end of the called PRACTICE script.

The **Break.Set** command also accepts the option **/RESUME** which will resume the program execution after the command **DO myScript.cmm** is executed. This is however not suitable in this case, since it won't wait until the called PRACTICE script has finished.
