Is it possible to use both μ Trace[®] connectors, A and B to debug two targets?

2024-10-24 - Comments (0) - Setup / update

Only connector A of the μ Trace[®] can be used together with a whisker cable for debugging. Debugging two targets using two whisker cables is only possible with the CombiProbe. The standard configuration of the μ Trace[®] is with a MIPI20T whisker cable plugged to connector A. The extended configuration is to add a TRACE32 Analog Probe plugged to connector B via a Converter μ Trace[®] to PI-Analog Probe. The TRACE32 Analog Probe enables an energy profiling of your application.
