## Is it possible to use both $\mu$ Trace<sup>®</sup> connectors, A and B to debug two targets?

2024-10-24 - Comments (0) - Setup / update

Only connector A of the  $\mu$ Trace<sup>®</sup> can be used together with a whisker cable for debugging. Debugging two targets using two whisker cables is only possible with the CombiProbe. The standard configuration of the  $\mu$ Trace<sup>®</sup> is with a MIPI20T whisker cable plugged to connector A. The extended configuration is to add a TRACE32 Analog Probe plugged to connector B via a Converter  $\mu$ Trace<sup>®</sup> to PI-Analog Probe. The TRACE32 Analog Probe enables an energy profiling of your application.
