"emulation pod configuration error"

[PowerArchitecture] "emulation pod configuration error"

2022-01-11 - Comments (0) - PowerQUICC III (internal / reps)

This error can have several sources:

- The CPU selection in the **SYStem** window does not match the CPU on the target. Check if the selection matches the processor on the target. Try to use automatic detection (**SYStem.DETECT CPU**).
- The CPU on the target is not supported by the used debugger software version. Please check if a new version is available in the Downloads section.

In any case please check the AREA window (Menu: View - Message Area) for further information.
