What is the difference between the operation modes "TRACE32 Simulator" and "TRACE32 Viewer"?

2026-01-19 - [Comments (0)](#) - [Setup / update](#)

**TRACE32 Simulator**

- Provides a built-in **Instruction Set Simulator**.

- Allows you to **load and execute programs** (e.g., ELF files) directly in the simulator.

- Useful for **simulating program execution** without requiring target hardware.

TRACE32 Viewer

- Designed for **off-line analysis**.

- Supports loading **programs, memory dump files, and trace recordings**.

- Enables reconstruction of a **saved target state** without hardware.

- Does **not support program execution**. Commands such as *Go*, *Break*, and *Step* are unavailable in this mode.

You can select between the TRACE32 Simulator or Viewer operation modes using the **Connection Select Dialog**:
