Hello,

The minimum system requirements for installing TRACE32 can vary significantly based on your specific use case. While TRACE32 can technically function on a system with a small amount of RAM, this might not be sufficient for all scenarios.

For instance, if you're using TRACE32 for small-scale projects, a system with 2GB of RAM might be sufficient. However, for larger applications, the memory demands could exceed 2GB. In such instances, a system with higher RAM (e.g., 8GB or more) and a more powerful processor would be necessary.

Ultimately, the minimum system requirements depend on your specific needs and the scale of the applications you are working with.

Best regards,

Firas.
